

How to update events on the website

A guide for the café — no coding, no developer. Ten minutes, start to finish.

You will use two things:

1. **The Events sheet** in Google Sheets — one row per event.
1. **Cloudinary** — where event photos live (cloudinary.com, log in with the café account).

The website reads the sheet every time it rebuilds. Whatever the sheet says, the site shows.

Adding a new event

Step 1 — upload the images to Cloudinary

1. Log in to Cloudinary and open **Media Library**.
1. Open the folder **events/banners** and upload the main poster/photo for the event (one image, landscape works best).
1. Open **events/galleries** and upload any extra photos.
1. For each image: hover it → click the **link icon (Copy URL)**. Keep these URLs handy — you'll paste them into the sheet.

Step 2 — add a row to the Events sheet

Open the spreadsheet, go to the **Events** tab, and fill a new row:

Column	What to put there	Example
active	TRUE to show it on the site, FALSE to hide it	TRUE
category	One of: Performance , Workshop , Exhibition	Performance
title	The event name, as it should appear on the poster	Rabindra Sangeet Evening
date	Year-month-day, with dashes	2026-07-04
time	Written however you like	6:00 PM
venue	Where it happens	Art-Teas-Tree Cafe
bannerUrl	Paste the banner image URL from Cloudinary	https://res.cloudinary.com/...
description	The main text. Leave an empty line between paragraphs	
additionalInfo	Performance → who is performing. Workshop → what people will learn. Exhibition → the curator's note	

galleryUrls	Photo URLs, one per line inside the same cell (press <code>Ctrl+Enter</code> on Windows, <code>⌘+Enter</code> on Mac for a new line)	
registrationUrl	Where people sign up — a Google Form, a WhatsApp link like <code>https://wa.me/91...</code> , a ticket page, or Instagram. Leave empty for walk-in events	

Step 3 — that's it

Save isn't a button in Google Sheets — it saves itself. The website picks the change up the next time it rebuilds and the event appears:

- on the **notice board** on the homepage (if its date hasn't passed),
- on its **own page**, with the right layout for its category,
- in the list at `/events/`.

Which category do I pick?

Performance — music, drama, stand-up, poetry, storytelling.

Workshop — classes and training sessions of any kind.

Exhibition — art, photography, installations, book shows.

Editing an event

Find the row, change the cell, done. Title changes also change the page's web address, so avoid renaming an event after you've shared its link.

Hiding an event

Set its **active** column to `FALSE`. The event disappears from the whole site but stays in the sheet, so you can bring it back any time. Past events don't need hiding — they move to the "already happened" list by themselves, and their page stays up as a memory with the photos.

Cancelling vs. deleting

Prefer `active = FALSE` over deleting the row. Deleted rows are gone; hidden rows can come back.

If something looks wrong

Problem	Check this
---------	------------

Event doesn't appear	Is active exactly <code>TRUE</code> ? Is the date written <code>2026-07-04</code> style? Has the site rebuilt since your edit?
Image is broken	Open the URL from the sheet in a new browser tab. If it doesn't show the photo there, re-copy it from Cloudinary.
Event shows under "already happened"	Its date is in the past — check the year.
The update build failed	The error message names the exact row and column that's wrong — fix that cell. A half-filled draft row can't break anything as long as its active is <code>FALSE</code> .

One habit prevents almost every problem: **keep a row's active set to FALSE until the row is finished.**
